

JAVA COLLECTION FRAMEWORK QUESTIONS

1. What is java collection framework?

Ans: java collection is framework in which we have predefined methods that are allowed to manipulate and access data easily. And make our programming faster.

2. Differences between ArrayList and LinkedList?

ArrayList: -

- ArrayList is used dynamic array internally.
- It is slower than LinkedList for manipulating the data.
- ArrayList acts as List only.
- It is better for sorting and accessing data.

LinkedList:-

- LinkedList is used doubly LinkedList data structure internally.
- It is faster to manipulate the data.
- LinkedList acts as List as well as queue both.
- It is better to manipulate the data.

3. What is the difference between Iterator and ListIterator?

Ans: Iterator is used in every collection because it is parent of collection. But ListIterator is used in List collection only.

4. What is the difference between Iterator and Enumeration?

Ans: Iterator is introduced in JDK1.2. It allows reading data and manipulation of data. Enumeration is introduced in JDK1.0. It accesses with only older collection like Vector. It allows only reading the data.

5. What is the difference between List and Set?

Ans: List is type collection. List allows duplicate values and also maintains the order of insertion. It stores multiple null values.

Set is also a type of collection. It does not allow the duplicate values. Set does not give guarantees of order. It stores only one null value.

6. What is the difference between HashSet and TreeSet?

Ans: HashSet uses Hashing algorithm internally but TreeSet uses BST algorithm internally. Both do not allow duplicate values.

7. What is the difference between Array and ArrayList?

Ans: Array allows to store same data type value but ArrayList allows to store different type of value. The size of Array is fixed but ArrayList is growable. Array is not easy to add or manipulate the data but ArrayList has some built-in functions which make it easy to store and manipulate the data.

8. What is Map in java?

Ans: Map is part of java collection. In which we have some built-in-method is provided which make easy to store and manipulate the data. It store value in the form of key:value pair. Key and value both can be duplicate in some implementations. The most important implementation is Hashmap, Hashtable etc.

9. What is difference between Hashmap and Treemap?

Ans: Hashmap is allow to null value. Order of insertion Is not preserved to preserved it we use linkHashMap. In Treemap order of insertion is not preserved but It give data in the sorted order based on the key.

10. How do you check if a key is exist in map in java?

Ans: to use containskey() or get() or keyset() method In java collection framework.
